Potential competing interests: No potential competing interests to declare.

This is an interesting comparative study protocol of the willingness-to-pay for health insurance and associate factors between formal and informal health workers. Here are some suggestions.

- a.What is the hypothesis of this study
- b.How to measure preference to schemes of health insurance and factors associated to WTP? Which variable will be used to describe socio-demographic characteristics?
- c.How many sthdy places will the study be conducted in?
- d.How will the convenience sampling technique be conducted?
- e.Will all data be collected by the semi-structured questionnaire?
- f.How many formal workers will be survey in the pre-test? And how many informal workers?
- g.What's the advantages of the CVM? Discrete Choice Experiment also can be used to value goods that are not currently avaiable.

Hope it helps!
