suggestions for Improvement:

- The study may lack a comprehensive review of recent or relevant literature, making it difficult to position findings within existing knowledge. Expand the literature review to include recent, high-quality studies relevant to the topic; clearly identify gaps your research addresses.
- Inadequate description of sampling, data collection, and analysis methods; neglect of complex survey design considerations. Clearly describe the study design, sampling procedures, data collection tools, variable definitions (including cutoff points for anemia), and analysis plan, considering survey weights and design effects.
- Superficial Discussion. Compare findings with existing literature; discuss potential mechanisms; address implications for policy or practice; acknowledge limitations and suggest future research.
