Greetings,

The article is interesting, and its conclusions and recommendations are important for public health.

However, there are several issues that are important to consider:

1. It is not clear from the table shown, the distribution of the data by years (2013-2017)
2. The division in the table shows male and female according to place of residence and the nature of the place of residence (rural or urban).
3. Therefore, the conclusion that there is an increase in life expectancy between the years 2013-2017 cannot be accepted.
4. All the sources are dated; they are all over 10 years ago.

After addressing these comments, it will be possible to properly publish the article.

Best regards
