

Review of: "Hospital's Thermo-neutral Zone for Patient Safety and Climate Change Sustainability"

Bashir Kareem

Potential competing interests: No potential competing interests to declare.

The manuscript requires significant revisions, addressing the following comments:

1. The title needs to be more precise and specific.
2. The English needs improvement.
3. Several factors influence thermal comfort, including air temperature and relative humidity, which are the most crucial. Additionally, factors like air velocity, radiant temperature, activity, clothing, etc., should be discussed.
4. Provide a brief description of energy consumption in Iraq and address the causes of electricity shortfall.
5. Improve the quality of the pictures, and clearly describe the parameters.
6. Mention the impact of the ventilation system on improving indoor thermal comfort.
7. Clearly demonstrate the novelty of the study in the introduction and explicitly state the research gap.
