Potential competing interests: No potential competing interests to declare.

This paper delves into the complexity of the human mind through research at the intersection of computer vision and psychology, changing the interface between artificial intelligence and human cognition, providing an in-depth study of psychological complexity, and revealing how computers the potential and application prospects of vision. The article is satisfactory, but I think there are still some shortcomings:

1. The introduction can be further improved, including, but not limited to, adding more comparative literature to illustrate the advantages and disadvantages of this article relative to other solutions.

2. Some potential limitations need to be taken into account when evaluating, such as limitations of research methods and the ability to generalize to the wider population.

3. You can consider adding some icons to better illustrate this research.
