# RSF1 wt Allele

National Cancer Institute

## Source

National Cancer Institute. *RSF1 wt Allele*. NCI Thesaurus. Code C52091.

Human RSF1 wild-type allele is located in the vicinity of 11q14.1 and is approximately 155 kb in length. This allele, which encodes remodeling and spacing factor 1 protein, plays a role in transcriptional repression, transcriptional co-activation and nucleosome assembly controlled by the RSF chromatin remodeling complex. The RSF1 gene is overexpressed in high-grade ovarian serous carcinoma.
