After carefully reviewing your work, I have some concerns.

Firstly, the write-up of your manuscript is not up to the expected standard. The abstract is too long and repeats the other sections. The introduction lacks a proper literature review of methods and compounds. The Method section does not provide enough details about all the studies carried out in this work. The Result section does not include any other parameters, only docking scores, and does not provide standard drug values. Also, the second paragraph of this section (This experimental survey has exhibited promising antifungal activities of the two naturally....) does not fit here and should be placed in the Introduction section. The reason behind the different docking scores for different compounds is not explained, and the selection of the conformer based on stability is also not included. The extraction procedure is not provided.

Moreover, in the Discussion section, there is no discussion based on the obtained results, particularly regarding the necessity of co-crystallization of the ligand and how to succeed in its formation. The Conclusion section does not consolidate the drug based on efficiency according to the results, and the necessity of this study, which has already been published, is not clear.

In addition, the Acknowledgement section mentions a project number that is not correct. Lastly, the reference section lacks recent references, and 15-20 more recent references should be included.

In summary, I cannot recommend publishing this manuscript as it stands. I suggest revising all the sections and addressing the issues mentioned above.

Thank you for the opportunity to review your work.
