Potential competing interests: No potential competing interests to declare.

The article seeks to associate COVID-19 infection with retinal vasculitis. This is good work, but there are several concerns.

1. The number of articles reviewed is insufficient, and the authors may wish to look beyond PubMed to other databases. Also, more clinical data is required. The article is based on data from 12 patients, which is insufficient.
2. The introduction section is too short and lacks references. Authors should cite relevant statistics for the statement "significant systemic and ocular implications globally."
3. Authors should discuss the limitations of the research.
4. Conclusion: What recommendations for further studies?
