INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Facial dysmorphism-lens dislocation-anterior segment abnormalities-spontaneous filtering blebs syndrome. ORPHA:412022*

Facial dysmorphism-lens dislocation-anterior segment abnormalities-spontaneous filtering blebs syndrome is a syndromic developmental defect of the eye characterized by dislocated or subluxated crystalline lenses, anterior segment abnormalities, and distinctive facial features such as flat cheeks and a prominent, beaked nose. Affected individuals may develop nontraumatic conjunctival cysts, also referred to as filtering blebs.
