Potential competing interests: No potential competing interests to declare.

This article mainly evaluates the emissions reduction effect brought by the uncertainty of the low-carbon environmental governance system. This topic has practical reference significance for exploring the feasible path of low-carbon development. I personally think this article can be improved from these two aspects, if possible.

1. This paper puts literature review and mechanism analysis into one part, but the purpose of literature review is to find out the current research gaps to illustrate the value of this study. The mechanism analysis is to present the internal logic of this paper from the theoretical level. Therefore, these two parts may be presented separately. I suggest that they be presented separately.
2. "1,2,3... 8" in Table 1 is suggested to be replaced with corresponding variables for the convenience of readers.
