

Review of: "Investigation of the effects of wet cupping therapy on some inflammatory factors in patients affected by non-alcoholic fatty liver disease (NAFLD): A quasi-experimental trial study with self-controls"

XiaoFeng Zhao

Potential competing interests: The author(s) declared that no potential competing interests exist.

In this self-controls and quasi-experimental trial study, authors observed the effect of wet cupping therapy on patients with NAFLD, especially some inflammatory factors. To some extent, it may be an effective alternative treatment. My detailed comments are as follows:

- 1 The sample size is small, and 4 patients have left, can you add the reason?
- 2 Have 16 patients received any other treatment during the period? Medications? It may affect the results, please specify it if not.
- 3 The part of discussion can be further analyzed.
