

Review of: "Perceived Social Support as a Predictive Factor of Fatigue and Quality of Life Among Healthcare Professionals in Greece"

Elizabeth Dominic

Potential competing interests: No potential competing interests to declare.

Congratulations to the authors for conducting a study that is highly relevant.

A few suggestions from my side -

Abstract:

The part 'Physical, mental, and overall fatigue were found to be significantly negatively correlated with family, friends, significant others, and overall social support. Their correlation was found to be significantly positive in terms of general health, as well as its individual subscales' lacks clarity.

Introduction:

There is confusion with respect to variables under study as the literature cited in the introduction part seems to be mixed. If the literature can be streamlined, i.e., citing the studies carrying only the variables under study, it would have been more crisp and concise.

It is not clear from the literature how social support can reduce fatigue.

Method:

Writing may be improved as sections are not usually mentioned.

Results:

Hypotheses testing is found to be missing.

Discussion:

Theoretical and practical implications seem to be missing.

Future directions for research are not identified or explained.

References:

May I know which style of referencing is followed?
