Dear Editor

This paper is really interesting and practical, and it is written clearly, but before publication, it is highly recommended to answer the below questions:

- 1- In the hydraulic section, I suggest presenting more and clear outputs: For example, you can select the main stream and extract the flood extents for different sections and plot them in a 1:1 graph to show the impacts of land use change on this factor. Also, you can plot the WSE for different periods.
- 2- Plot and present the changes of each land use in different time periods. Also, it's suggested to calculate the ESV impacted by flood for different periods.
- 3- Plot the transition probability matrix for some time periods.
- 4- Calculate the risk factor for each land use and each time period.
