**Potential competing interests:** No potential competing interests to declare.

This research note is an excellent comprehensive review of the various efforts in therapeutics against the prevention and treatment of Dengue. It was interesting to note that various natural medications including Flavinoids from natural substances are used for the treatment by inhibiting the proliferation of the Dengue virus. The second paragraph on vector control with sterile techniques and Wolbachia was not very clear. It would also help the readers to know what Wolbachia is. So please mention a few words describing Wolbachia. The effect of Metformin and Statins on Viral replication is clear. Lovastatin and Atorvastatin are fat soluble statins. Does water soluble statins like Rosuvastatin also have a same effect. Please mention a few words about that. Overall it's a good review with minor changes mentioned above.
