Potential competing interests: No potential competing interests to declare.

Here are my contributions to the manuscript:

- Please check and correct if the animals used were mice or rats. At times one species is mentioned, and at other times another species is mentioned.
- In the topic "Experimental design," adjust dose measurement units (ml/kg body weight).
- The method of obtaining the plant extract is missing. It is extremely important to describe the method and also the chemical composition of the extract to validate the experiment. Please describe the solvent used, the extraction method, and the chemical analysis/cite the paper validating the method for extracting the majority compounds, or whether it was purchased from a company.
- Check the CAT result in the text; the value differs from the result presented in the table.
- Was a post hoc test (Tukey, Bonferroni...) used in statistical analyses? It is not mentioned in the tables, and there are significant results; however, without a description of the test and an appropriate subtitle indicating the difference between the groups.
