Kenneth *et al.* conducted the study "toxicity of *olea africana* in *Artemia Salina* and Mice. The research is remarkable, detailed and straight to the point.

Meanwhile the researchers have their work presented without the proper use of the English Language. Therefore, few grammatical constructions should be reconsidered.

Also, the background of the study can be more advanced by briefly highlighting other published work about the plant.

Furthermore, plant authentication should be well detailed. What department and officer authenticated the plant and on what date was the authentication carried out. The permission for ethical compliance of animal use should also contain such details. where experimental animals were obtained should also be well spelt, and the body weight of the animals should be taken and recorded.

The presentation of results and discussion was conducted after considering a good amount of other research.

Great Research Kenneth *et al.*
