The authors presented an interesting study based on the structural modification of a commercial drug. The synthesis is simple and leads to a series of novel compounds, which were properly characterized. However, I suggest that the authors carry out the HRMS analysis of their molecules. The biological results were mostly poor and limited since only two microorganism strains were used. The lack of complexity of the work also limits the analyses, so I suggest the authors expand their biological studies. Finally, the authors should submit their text for a revision of the English language to improve it.
