Potential competing interests: No potential competing interests to declare.

This study was an open-label randomized clinical trial. The authors investigated the effects of supplementation with *Moringa oleifera* on the antioxidant and oxidative stress markers of infertile women. This study revealed that an increase in oxidative stress biomarkers is associated with female infertility. Supplementation with *Moringa oleifera* in infertile women could help reduce the effects of OS among infertile women and might likely improve pregnancy outcomes.

This is a good pilot study which should be followed by other long-term follow-up studies to confirm the results of the present study.

It is a well-designed study, and the results and discussion are interesting. I recommend this manuscript to be published in your journal.
