# Review of: "The Mediterranean Islands: Demographic Convergences and Divergences, 1995–2021"

Stamatina Kaklamani<sup>1</sup>

1. Sociology, University of Crete, Greece

The author examines the insular parts of EU countries, studying their demographic status and trends for the period 1995–2021. The study is conducted by using key structural indicators, the components of natural population growth, and synthetic fertility and mortality indicators. The work is particularly systematic, which provides a clear picture. The choice of methods to synthesize both the changes that have occurred and to arrive at a certain typology of the demographic status and future of the included island populations is effective. Its synthesis provides a comprehensive understanding of the demographic profile of the populations studied. From this perspective, its contribution is significant, allowing other social researchers to conduct an in-depth analysis of the historical and socio-economic factors leading to the demographic transformations that have occurred.
