Potential competing interests: No potential competing interests to declare.

Overall, this article highlights the importance of addressing both educational and societal factors to improve young adults' understanding and communication about sexuality and relationships. As a suggestion for the author, it is recommended to consider the following points:

- In the abstract section, it is necessary to include the type of qualitative data analysis used and the technique employed to select the 14 participants.
- For research implications:
 - There is a need to develop educational content that addresses both the physical and emotional aspects of sexuality, consent, and intimate relationships to better meet the needs of the younger generation.
 - These findings call for policymakers and educators to update and adapt the curriculum to foster a better understanding of sexual health and communication among students.
 - Strengths:

The use of qualitative methods and IPA allowed for an in-depth exploration of personal experiences and perceptions, providing a nuanced understanding of the topic.

- Recommendations for Future Research:
- Conduct studies with larger and more diverse samples to validate the findings across different demographics and cultural contexts.
- Explore the role of digital media and social networks in shaping young adults' perceptions of consent and intimacy.
- Investigate the effectiveness of various approaches to sex education in improving knowledge and attitudes toward sexual health and relationships.
