Potential competing interests: No potential competing interests to declare.

The work is based on quantile regression for identifying latent structures in COVID-19 pandemic. The work is well laid out with current references.

However more references should be listed and cited.

The inclusion of Examples from Nepal is unnecessary in the topic, or should be rephrased since studies from other countries are included.

Justification for the use of quantile regression over other statistics tools should be made.

Overall, the manuscript may be considered for publication after revision.

Thanks
