Potential competing interests: No potential competing interests to declare.

Food security is a pertinent topic, currently facing several challenges such as climate change and the predicted increase in the world's population by 2050. The study integrates climate data, agricultural data, and energy data, adopting a holistic approach to understand the complex interactions between climate change and the food and energy sectors, which I consider to be a great strategy. I believe that the use of statements from the IPCC report (AR6), instead of statements from the IPCC report (AR4), would make the article more robust. Furthermore, the article presents a discussion exploring the importance of implementing adaptation and mitigation strategies to address these impacts, such as water conservation measures, coastal protection initiatives, and transition efforts to renewable energy sources.

The article is publishable with the suggested changes.
