Potential competing interests: No potential competing interests to declare.

EEG-based Emotion Classification using Deep Learning: Approaches, Trends and Bibliometrics is the title of the paper.

The paper is very well written and expressed.

The literature review is very detailed.

One suggestion that I would give is that you could create an overall general flow or architecture diagram from the literature review, incorporating the related works methodology to give a detailed pictorial comparison.

Figure clarity can be better.

Overall, good literature review work.
