Potential competing interests: No potential competing interests to declare.

This paper describes the effects of vitamin D, zinc and quercetin administration on the clinical course of a patient with Covid-19. The work has several bias. It is likely that the change in the clinical course of Covid-19 was due to the usual evolution of this disease and not to the substances given. There is no evidence that this patient was deplete in vitamin D and zinc and it is known that vitamin D supplementation might have a positive effect on Covid-19 only when the patient is vitamin D-deficient. I don't believe that this case report can be accepted
