**Potential competing interests:** No potential competing interests to declare.

The basic idea of the article is good; however, it lacks depth, details, a proper related works review, a mathematical model, and different scenarios simulation. It also lacks proper in-depth analysis, discussion, and focused application. The paper looks more like a practical project that uses sensors. It is recommended to direct the work towards the mapping of air quality and pollution in smart cities with intelligent pattern recognition software and multi-sensor application.
