Potential competing interests: No potential competing interests to declare.

This essay highlights a significant and unsettling phenomenon. This article is succinct, direct, and well-structured. It still lacks the thoroughness that a scientific paper requires, but it may still be a fine editorial or introduction to the subject.

Of course, honorary authorship is not only used in biomedical publications; it is much more common and likely applies to the majority of scientific and engineering disciplines. Additionally, it is not just restricted to the individuals, we may discover that institutions engage in similar activities in an effort to raise the volume of scholarly publications and the impact factor in order to achieve objectives related to universities ranking and funding growth.

In order to address this issue effectively, more research and analysis are required. Artificial intelligence algorithms may also be used to examine data. It is also necessary to discuss the part that publishers can play in creating a system for identifying infractions and punishing offenders.

If the author is interested, I advise him to intensify and broaden his efforts because the work and topic need more exploration.
