**Potential competing interests:** No potential competing interests to declare.

Fig. 1 shows where the sites are used in time trend figures at the end.

Fig. 3 test  $r^2$  for significance using p values. For max temps slopes appear similar, prove that. For minimum temps, slopes seem to differ, why? Any of the 4 sites sig for rainfall?

Useful review. Make clearer where Fig 3 sites are and more rigorous analysis of the trends.
