Potential competing interests: No potential competing interests to declare.

The article in question employs a research method based on electronic surveys, which may present significant limitations, especially within the Syrian population. A crucial point to consider is that this method might discourage participation from older age groups, who may not be as familiar with technology or prefer more traditional research methods, such as in-person interviews.

Additionally, electronic sampling can result in a non-representative sample of the population, leading to potential biases in the results. It is essential to consider the diversity of cultural practices and access to technology, which can vary widely among different demographics.

Therefore, I suggest that the article discusses the implications of this sampling method and considers the inclusion of alternative approaches that ensure a more comprehensive representation of the studied population.
