Potential competing interests: No potential competing interests to declare.

The following issues have been noticed and better be reconsidered:

1- The specific date of performing the study should be mentioned in the methods. It is a very important step although it is mentioned later in the discussion part.

2- In the results section, these notes should be clarified here:

a- The authors have used the terms frequencies and percentages interchangeably and this should be avoided as they have used these terms differently within the table.

b- The distribution of the percentage of vaccination among the different studied groups is not mentioned. This might have an impact on the difference in number of cases that has been noticed between the clinical and pre-clinical students. If there was a significant difference between the vaccinated participants in preclinical years compared to those in clinical years, this would have a great impact on the statistical results.

3- The conclusion should be reconsidered in the scope of the vaccination status of the participants as mentioned in the previous notes.
