Potential competing interests: No potential competing interests to declare.

Overall, the paper is acceptable without any second thought.

If the author is making the following statements, it will be better:

- **Clarify the Abstract and Introduction** because the abstract provides a good overview but could benefit from a clearer statement of the main findings and contributions by mentioning the gap in current research that your paper addresses to catch the reader's interest from the beginning.
- **While the technical depth is impressive, consider simplifying the language** for readers not familiar with the specific domain of data mining. For example, when introducing complex algorithms like K-means, a brief summary of what this algorithm does and why it is useful could make the paper more reachable.
- **Address Limitations and Future Work**, this not only strengthens your paper but also helps set the stage for future work in this area.
