In their praiseworthy review article, the authors delineate their investigative approach to understanding the factors influencing Electric Vehicle (EV) adoption in India. Utilizing a deductive approach, they explore the unfolding of these factors in developed nations while also emphasizing their relevance in developing countries. Additionally, the authors skillfully employ an iterative application of the inductive-deductive approach, culminating in the development of a taxonomy that categorizes these factors into micro-, macro-, and meso-level antecedents. The application of this taxonomy, as elucidated in the article, is commendable and offers a valuable framework. It has the potential to serve as an organizational tool for systematic and cohesive initiatives aimed at promoting EV adoption in developing countries. Moreover, the article underscores the importance of customizing these factors to align with the unique infrastructural, economic, and market requirements characteristic of developing nations.
