This article on pelvic floor exercises for patients is a qualitative study to interview professionals' approach to the treatment of women with pelvic floor medical issues. Pelvic floor medical issues are common and often missed in the medical community. They affect 1/3 of women in their lifetime, and diagnosis is often missed, leading to a missed opportunity for treatment and improvement of quality of life. Excellent research for interviewing health care professionals and discussion of treatment in rehabilitation centers.

It may be useful to include nursing for continence diaries and physicians for causes of incontinence, e.g., CHF, chronic renal disease, DM, and cough (which) increases with certain medications, e.g., ACE inhibitors like captopril.

Excellent study and important to develop Zguidelines for pelvic floor/continence in women to improve quality of life.

Sincerely,

Dr. Jean Triscott BSc, BED/AD , CCfP(COE), FAAFP, FCCFP
