Potential competing interests: No potential competing interests to declare.

This article nicely documented socio-ecological perspectives of forest conservation in Cambodia from the different stakeholders' perspectives. REDD+, being one of the key objectives of many global forums and institutional projects, experience earned through this project and their documentation, will help other parts of the world to deal with similar projects. The ethnographic surveys led to the identification of some very pertinent themes developed out of deforestation. However, validation and correlation of findings with some other techniques like remote sensing and GIS would have been helpful.
