Dear Authors,

I appreciate reviewing the manuscript "The Perception of Nurse Case Care Managers About the Needs of Cancer Patients". It deals with a relevant and interesting issue. However, some adjustments are needed to clarify the understanding and improve the methodological coherence.

Abstract:

-What does AUSLs mean?

-Oncology case care managers? Case Care Manager (CCM) nurse practitioners? CCM? – please define and standardize who the participants were.

- It seems the results do not align with the conclusion; please review it. The conclusion must answer the research question/objective.

Introduction:

- Reorganize the text and integrate the information without subheadings. The last paragraph should state the research objective or research question.
- Opt to use neutral gender writing, avoiding "he or she."
- Avoid direct citation; substitute it with authorial writing (e.g., "abilities, functions, tasks, competencies, and role responsibilities, according to the position or title that each person holds" in the organization of care.").

Method:

Some important information is missing.

- Verify all the items on the COREQ checklist to report qualitative studies.
- How was data collected? Interviews and focus groups? The abstract mentions just interviews...
- Explain NCCM.
- Clarify the setting (e.g., city, country).
- Explain the anonymization of the quotes.

- “The semi-structured interview lasted approximately 40 minutes” - add to the Results section.
- Data analysis should be reorganized, first with the theoretical information about Thematic analysis, then add how the analysis was proceeded.

Results:

-Please present a figure or a table with the themes and subthemes.

Discussion:

- Refer to the literature in the The CCM as a reference figure for patient and family and Quality of information and disease awareness.
- Please discuss the centrality of CCM nurses in healthcare and the possibilities of teamwork.
