Potential competing interests: No potential competing interests to declare.

In this study, the authors aimed to assess the current state of use of AI in education and e-learning, trying to highlight the benefits as well as limitations, and potential ethical considerations associated with the same.

This article is of limited significance and there are several considerations regarding the methodology.

- The authors start the results with a generic statement "The use of AI in e-learning has emerged as a promising solution to address the challenges of traditional e-learning methods." On what basis or difference in effect size of what outcome does this statement get justification from?
- The article is very concerned with the use of ChatGPT - which is just a LLM subset of AI, not reflective of the title of the study.
- At best a blog article - where the author cherry picked some points - does not follow any structure of an actual research study and adds no novelty to the existing literature.
