The article brings an interesting subject and has a clear argument. It is certainly a contribution in the field of Neuroeconomics studies. Nevertheless, some aspects could receive more detailed research, like Russian political and economic history. We may not assume that our cognitive reactions are simply restricted to an actual kind of State framework. Furthermore, we may not be satisfied with an analysis of behavioral reactions, for it is also important to understand what causes this behavior. Thus, which situational logic, grounded in a social structure, provides people's perceptions of the reality and their corresponding behavior? Last but not least, what are the limitations of the Neuroeconomics approach? The author listed the advantages, but in which cases the theory loses explanatory power?
