

Review of: "Antimicrobial Sensitivity of Plant Extracts of *Acacia arabica*, *Prosopis juliflora*, *Abutilon indicum*, and *Bryonia laciniata* on *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Escherichia coli*"

Mariana Romo-Castillo

Potential competing interests: No potential competing interests to declare.

Now, this research area is getting attention, and it is essential to analyze the potential of many plants formally. The work is fascinating, but significant modifications are needed for its acceptance.

Section 2.2: What was the yield of the extracts? Which concentration did they have? It is necessary to demonstrate the composition of the extracts; you should at least present a qualitative analysis of the extracts.

Section 2.3: The authors don't describe the characteristics of the strains. Are they clinical isolates or reference strains?

Section 2.4: Which was the concentration tested for each extract? Why did you try different concentrations?

It is necessary to review the measure units of section 3.2. It needs to be clarified when they are talking about mm or cm.

Please review.

Sections 3.3 and 3.4 don't have descriptions. The sections need to be completed. They have to describe the images to make them easy to understand.
