**Potential competing interests:** No potential competing interests to declare.

The authors' article showcases a well-structured and lucid presentation. However, the reading experience often becomes monotonous and wearisome due to the consistent repetition of the same arguments. Another noteworthy observation is the absence of supporting data to substantiate the presented arguments. Like other reviewers, I believe that this lack of data and evidence prevents the article from meeting the criteria for a research paper. Additionally, there is limited discussion regarding battery lifespan and the current state of research aimed at extending it. Furthermore, the potential application of second-life battery usage in stationary systems remains unexplored. To strengthen the arguments presented, a more comprehensive analysis is needed, encompassing emissions throughout the entire electric vehicle production chain, from inception to disposal.
