I appreciate the opportunity to review this work.

This study is interesting because it involves different types of almond samples from different locations in Yemen. Thus, it becomes exciting to identify the chemical content of the samples.

Here are suggestions for improvement.

This manuscript needs to be reviewed in terms of writing and sentence clarity.

Please review the data in the discussion (there are differences with the data in the Table).

Please use the same sample names in the discussion and in the Table.

Please check the data formatting in terms of decimal points (Table 2, 4, 5).

Thank you
