# Ossifying Fibromyxoid Tumor

National Cancer Institute

## Source

National Cancer Institute. *Ossifying Fibromyxoid Tumor*. NCI Thesaurus. Code C6582.

A rare soft tissue tumor of uncertain lineage characterized by the presence of neoplastic spindle to round cells forming cords in a fibromyxoid stroma. The lesions are associated with the formation of metaplastic bone. Most patients present with painless subcutaneous masses. Recurrences have been reported in a minority of patients.
