This manuscript warrants rejection. Here are the comments:

1. The entire text requires thorough proofreading.
2. Authors should adhere to the journal's author guide instructions and make necessary revisions accordingly.
3. The abstract should include a complete description of the computation method.
4. The abstract and conclusion sections should not duplicate each other.
5. To improve the comprehensiveness of the discussion section, authors are advised to include all findings from tables, covering both maximum and minimum values, as well as any anomalies. Additionally, authors should provide a detailed rationale for incorporating this data into the narrative and explore potential physical or chemical explanations for the study's observations and measurements.
