Ioxaglate Sodium

National Cancer Institute

Source

National Cancer Institute. *Ioxaglate Sodium*. NCI Thesaurus. Code C47572.

The sodium salt form of ioxaglate, an organic iodine compound and a radiographic contrast medium. Ioxaglate sodium blocks x-rays as they pass through the body, thereby allowing body structures not containing iodine to be visualized. The degree of opacity produced by ioxaglate sodium is directly proportional to the total amount of the iodinated contrast agent in the path of the x-rays. The visualization of body structures is dependent upon the distribution and elimination of ioxaglate sodium. (NCI05)
