

Review of: "[Review Article] Excessive Aluminum in Soil"

G. R. Rout

Potential competing interests: No potential competing interests to declare.

The authors should have taken proper care in writing a scientific review. This is not an initial review of aluminum toxicity in plants. Many reviews have already been published in various journals. The authors should review and update the work that has already been published. There is no sequence in which to write such a review. The authors should focus more on the cellular mechanisms and interaction with other nutrients and heavy metals. The phytoremediation technique and methodology cannot be elaborated further, but put more effort into how plants detoxify aluminum with biochemical and molecular mechanisms.
