The article "The Shortage of Professionals/Skilled Workers: Its Impact on the Inflation Rate in the Eurozone" analyzes an interesting and actual topic. Due to demographic changes, the whole economic system is affected. This article starts by making a literature review regarding two tools for research, the Beveridge curve and the Phillips curve. In my opinion, it is necessary to mention more interesting studies that investigated the same problems. Further, I recommend translating that paragraph into English for easier understanding by readers.

Starting on 1st January 2023, the EMU has 20 members, not 19, since Croatia joined the Eurozone.

It was obvious that the results would differ by countries or by groups of countries, but I think it is necessary for the authors to give more explanations for these heterogeneous results. Also, taking into account the heterogeneous results, I think it is better to mention specific solutions.
