**Potential competing interests:** No potential competing interests to declare.

1-It would be interesting for a review to include references throughout the text. Some excerpts are without references.

2- Would it be interesting to expand with a discussion on the proposed topics such as etiology, diagnosis, transmission, immunity, among others, or is the proposal to carry out a less in-depth review of the topic?

3- As far as my expertise is concerned, HPV is related to oral lesions, mainly in oropharyngeal lesions (which was presented in the text). It would even be a good idea to differentiate between screening and diagnosis of injuries, as diagnosis is only possible after screening.

4- It is also important to identify all injuries and remove all injuries to their full extent. In this sense, we have published work showing the use of fluorescence in tracking and determining the extent of an oral lesion. see at:

<https://pubmed.ncbi.nlm.nih.gov/31090794/>

In this sense, it would be interesting to explain the treatment of lesions and the potential for recurrence or reinfection.
