Potential competing interests: No potential competing interests to declare.

This work discusses the link between the rate and the concentration of interest in autocatalytic reactions. There are some comments that need to be responded to.

1. The novelty of this work needs to be explained in detail. Is it merely complementary to previous work?
2. The methodology of this work is missing.
3. The work focuses on Simple reaction, Ostwald's lactonization example, Landolt reaction scheme, and CSTR as an example of flow system, respectively. But the explanation of their being used as examples is not clear. What is the relevance between them? What is their contribution to this work?
4. As a suggestion, future research progress is needed to be highlighted in the conclusion.
5. Words such as "I," "we," and "us" appear in the manuscript, which need to be avoided.
