This paper, "Exploring the Significance and Medicinal Potential of *Rubus fraxinifolius*: A Review of the Ragimot Wildberry," is important to conserve the *Rubus fraxinifolius* plant species endemic to Borneo and to provide economic benefits to local communities and human welfare. This study lacks some important points and figures to be understood better by readers. The subsections and structure of the manuscript need some modification. I recommend adding some important tables and figures for better understanding, as this will also increase the quality of the manuscript and journal.

Some points need to be added to the manuscript:

- 1. The author must show the geographical distribution of the plant (*R. fraxinifolius*) through a map.**
- 2. The author must show and compare the nutritional compositions and amounts of their content of the plant *R. fraxinifolius* with other species of the *Rubus* genus in table form.**
- 3. The author must show the anti-oxidant or anti-inflammatory pathways of the plant (*R. fraxinifolius*).**

After the addition of these points, I recommend this for publication; otherwise, I'm not interested.
