It is a very interesting manuscript that provided some interesting information on beach erosion, due to dredging and the impact of it.

However, there are some issues on the methodology that need to be dealt with by the authors before any consideration for publication. For example, the methodology used for the estimation of erosion. I am not very keen on using Google Earth as a method to depict changes that might have happened on the coastline. It would be better to use a GIS software like QGIS, ArcGIS, and digitized maps of the area to better present the changes.

If this issue is dealt with, I believe that would be OK.

Any further comments on the manuscript could be found in the attached file.
