The authors conducted very interesting research work, providing a new approach to reusing plastics. Although good results have been obtained, there are some remarkable points that the authors should take into account.

1. What if a higher plastic concentration is used? For example, 70%, 90%.
2. Can porosity be controlled?
3. There are some misleading phrases/sentences in the present manuscript, and English writing polishing is required.
4. Do plastics from different sources affect the mechanical properties of the prepared materials?
