# FARSB wt Allele

National Cancer Institute

## Source

National Cancer Institute. *FARSB wt Allele*. NCI Thesaurus. Code C54256.

Human FARSB wild-type allele is located 2q36.1 and is approximately 86 kb in length. This allele, which encodes phenylalanyl-tRNA ligase beta subunit protein, plays a role in the mediation of translation through the regulation of the synthesis of amino acid/transfer RNA complexes.
